

CASE OF THE MONTH

April 2021

CUSTOMFLEX® ARTIFICIALIRIS

Images and case provided courtesy of Steven G. Safran, M.D., P.A., Lawrenceville, NJ.

.....

Patient referred with most of his iris missing from surgical trauma. A large calcified Soemmering's ring is dislocated into the visual axis, which is also causing chronic iritis/CME; and, the old PMMA IOL is loose and dislocated. We removed the IOL and large S ring, sutured a CZ70BD IOL, a With-Fiber CUSTOMFLEX® ARTIFICIALIRIS using GORE-TEX®; combined with PPV and removal of remaining chips and endolaser to retina tear discovered during surgery.

**Surgical Video
provided:**

At 1 month post op, patient's vision had improved to 20/40 uncorrected from CF and is extremely pleased with the functional and cosmetic gains. He is very grateful for this technology and feels that it was well worth the wait!
