

# CUSTOMFLEX® ARTIFICIALIRIS: Photo of the Month

71yo female born with congenital aniridia, who lived with extreme photophobia and poor vision since birth. The formation of a cataract OU further impaired her already reduced visual functioning, leaving her unable to complete even the most routine daily tasks.

Thanks to a combined cataract surgery along with implantation of a CUSTOMFLEX® ARTIFICIALIRIS, this patient was able to regain control of her life with 20/30 vision and significant reduction of her lifelong battle with blinding glare. Of note, she even got to "choose" the new color of her eyes; when asked what color eyes she wanted, she quickly turned toward her husband of many years and stated "I'll take his color eyes, so we can match."

Case and images provided by Dr. Richard Sayegh, DO, Cataract/LASIK Specialist, Koch Eye Associates
